

TUTORIAL 14

14.Study and document the functionality of TestLink for test management.

Study Report: Functionality of TestLink for Test Management

1. Introduction to TestLink

TestLink is an open-source **web-based test management tool** that helps software teams **plan, develop, execute, and track** software testing activities.

-  **Official Website:** <https://testlink.org>
-  **Developed in:** PHP and MySQL
-  **Purpose:** Test planning, test case creation, test execution, reporting

2. Key Features of TestLink

Feature	Description
 Test Case Management	Create, organize, and manage reusable test cases
 Test Plans	Create test plans, assign test cases, schedule testing
 Test Execution	Execute test cases, record pass/fail status, add notes
 User Management	Multiple roles like admin, tester, leader with access control
 Reports & Metrics	Summary reports, pie charts, test coverage, results
 Integration	Integrates with tools like Bugzilla, JIRA, Selenium, etc.
 Requirements Mapping	Map test cases to requirements (traceability)
 Role-Based Access Control	Define what each user role can view or edit
 Custom Fields and Keywords	Add metadata to organize and filter test cases

3. Major Modules in TestLink

Module	Function
 Test Project	Main container for all testing activities
 Test Suites	Logical grouping of test cases (folders)
 Test Cases	Individual test scenarios with steps and expected outcomes
 Test Plan	Collection of test cases for execution
 Test Execution	Performing and recording results
 Requirements	Define and map functional requirements
 Reports	Generate summary, coverage, and result reports

4. How TestLink Works (Step-by-Step)

Step 1: Create a Test Project

- Define project name, prefix, requirements, and options
- Acts as a parent for all test activities

Step 2: Create Test Suites and Test Cases

- Organize test cases in hierarchical folders (test suites)
- Add test steps, expected results, and keywords

Step 3: Create a Test Plan

- Select which test cases will be executed
- Assign builds and assign test cases to users

Step 4: Execute Test Cases

- Navigate to **Test Execution**
- Run test steps and mark them as:
 -  Passed
 -  Failed
 -  Blocked

Step 5: Generate Reports

- Use **Reports & Metrics** module to:
 - View execution status
 - Analyze test case coverage
 - Export reports to PDF/Excel

5. Integration Capabilities

Tool	Purpose
 Bugzilla	Auto-report failed test cases as bugs
 JIRA	Track issues linked to test execution
 Selenium	Automated test execution through plugins
 CI/CD Tools	Integration with Jenkins for automation pipeline

6. TestLink Test Case Lifecycle

Created → Reviewed → Approved → Assigned → Executed → Reported

- Test cases are first created and reviewed.
- Approved test cases are added to test plans.

- Testers execute them and report results.
- Bugs can be linked or reported.

7. User Roles and Permissions

Role	Permissions
Admin	Full access to all features and user management
Test Leader	Manage projects, test plans, and test cases
Tester	Execute test cases, report results
Guest	Read-only access to reports

8. Sample Test Case Entry in TestLink

Field	Value
Test Case Title	Login Page – Valid Credentials
Summary	Verify login functionality with correct credentials
Preconditions	User is registered
Steps	1. Enter username2. Enter password3. Click Login
Expected Result	User should be redirected to dashboard
Execution Type	Manual
Keywords	Login, Functional

9. Advantages of Using TestLink

Benefits

- Open-source and free
- Web-based interface

- Easy test case reuse and traceability
- Integration with multiple tools
- Centralized test repository

Limitations

- UI is not modern
- Lacks detailed automation support natively
- Requires separate bug tracker (e.g., JIRA, Bugzilla)

10. Student Activity Example

Task: Create a project in TestLink for testing an e-commerce login module

Steps:

1. Create a test project: “E-commerce Login Testing”
2. Create a test suite: “Login Functionality”
3. Add 3 test cases (valid login, invalid login, empty fields)
4. Create a test plan and execute the test cases
5. Generate a test execution report and submit a screenshot

11. Conclusion

TestLink is an essential test management tool that helps software testers organize and track test cases, improve test coverage, and integrate with bug tracking systems. It’s ideal for both manual testing and automation pipelines (via plugins).
